EXP NO :07

Integrating a Zoho Creator Application with Another Zoho Service Using Connections and APIs

Aim

To integrate the Loan Application Management System in Zoho Creator with another Zoho service using connections and APIs to exchange data and automate business processes.

Application Design

1. Create a Loan Application form in Zoho Creator.
2. Add fields such as Applicant Name, Email Address, Contact Number, Monthly Income, Loan Type and Status.
3. Create a workflow that triggers after successful form submission.
4. Configure a connection to another Zoho service, such as Zoho CRM.
5. Use Deluge scripting to send application details to the connected service.
6. Test the integration and verify that the data is transferred successfully.

Deluge Example

```
leadData = Map();

leadData.put("Last_Name", input.Applicant_Name);

leadData.put("Email", input.Email_Address);

leadData.put("Phone", input.Contact_Number);
```

```
response = zoho.crm.createRecord(
    "Leads",
    leadData,
    Map(),
    "zohocrm_connection"
);

info response;
```

Note: Replace Applicant_Name, Email_Address, and Contact_Number with your actual field link names. Replace zohocrm_connection with your configured Zoho CRM connection link name. The CRM Leads module requires a Last Name field; if your applicant name is stored differently, adjust the mapping accordingly.

Observation

- The Zoho Creator application collects loan applicant information.
- A workflow triggers the integration script after successful submission.
- The Deluge script sends applicant details to Zoho CRM through an authenticated connection.
- The API response indicates whether the record was created successfully.

Validation

1. Submit a loan application with valid details.
2. Check whether the workflow executes successfully.

3. Verify the API response in the workflow logs.
4. Open Zoho CRM and check whether the lead was created.
5. Test missing or invalid data and check how errors are handled.

Discussion

Zoho Creator connections provide authenticated access to other Zoho services. Deluge scripts can use APIs to transfer information and reduce manual data entry. Proper field mapping, permissions, connection configuration, and error handling are essential for successful integration.

Result

The integration approach between Zoho Creator and Zoho CRM using connections, APIs, and Deluge scripting was demonstrated. Successful data transfer must be verified by executing the workflow in the configured application.
