EXP NO :10

Performance Optimization of the Zoho Creator Application

Aim

To optimize the Loan Application Management System for better performance and faster response.

Application Design

1. Review forms, reports and workflows for unused fields and unnecessary actions.
2. Limit the columns and records loaded in reports using filters.
3. Use criteria in fetch statements so that only the required records are retrieved.
4. Avoid fetching records inside loops and combine repeated operations.
5. Test the application before and after the changes.

Deluge Example

```
pending = Loan_Application[Status == "Pending"];
info pending.count();
```

Observation

- Filtered fetches are faster than retrieving all records.
- Smaller reports load more quickly.
- Simpler workflows reduce execution time.

Validation

1. Open the report and measure the loading time.
2. Compare the result before and after applying the filters.

Result

Thus, the application was optimized for better performance.
