EXP NO :14

Extending the Zoho Creator Application Using Pro-Code (Deluge)

Aim

To extend the Loan Application Management System using pro-code Deluge scripting for custom validation.

Application Design

1 Open the On Validate event of the Loan Application form.

2 Write a Deluge script to check the applicant's age and monthly income.

3 Cancel the submission and display an alert when a condition is not met.

4 Save the script.

5 Test with valid and invalid data.

Deluge Example

```
if(input.Monthly_Income < 15000)
{
   alert "Monthly income is too low for this loan";
   cancel submit;
}
if(zoho.currentdate.year() - input.Date_of_Birth.year() < 21)
{
   alert "Applicant must be at least 21 years old";
   cancel submit;
}
```

Observation

- Pro-code scripts add logic that drag-and-drop tools cannot provide.
- Invalid applications are stopped before they are saved.
- Low-code and pro-code can be combined in the same application.

Validation

1 Submit an application with income below the limit and check the alert.

2 Submit a valid application and check that it is saved.

Result

Thus, the application was extended using Deluge pro-code for custom validation.
